

ABSTRACT OF THE DISCLOSURE

This invention provides a paintball gun anti-blocking device, which is to set an infra-red receiver and shooting means near the bottom of the predetermined portion of the inner wall of the gun tube to detect if the lights on both receiver
5 and shooting means are interconnecting when the paintball enters the normal position forming "OFF" status for the message of blocking of the paintball gun, while if both lights are blocked, it will form the message of "ON" meaning it is O.K. to shoot; meanwhile an infra-red receiver and shooting means are settled on the upper and lower movement limit position of the trigger as to detect if the
10 trigger has completed to press the shooting position, while both lights are interconnecting, it forms the blocking message of "OFF" message, besides, when both lights are to be blocked, it then forms shoot-able status of "ON" ; by means of this to be the basis of actuate while the gun triggers the paintball when the paintball gun is shooting.
